Task ‘Collaborative Discussion Summary Code of Ethics and Professional Conduct’ Unit 1

Peer Response 1

Hi Payman,

Your post highlights and explains few very important ethical issues clearly and it links them to real responsibilities in the computing profession. I particularly agree with your point that affordable medical technology should not come at the expense of patient safety and privacy. Your comparison of the ACM and BCS codes also show that professionals have responsibilities beyond simply making sure a system works as intended.

(ACM, 2018; BCS, 2019)

One point I would add is that vulnerability should not be dismissed just because the immediate risk seems low. Although Corazón consulted technical experts, it is important to consider what could happen if someone exploited the weakness in the future.

(ACM, n.d.)

Research examined cybersecurity vulnerabilities in medical devices and found issues that included high and critical-severity risks.

(Bracciale, Loreti and Bianchi 2023)

This supports your argument that vulnerabilities should be properly documented, investigated and reviewed, even when the likelihood of exploitation appears limited.

I also agree with your recommendation for regular security assessments. The need to discuss the importance of considering cybersecurity risks when assessing the benefits and risks of medical devices.

This suggests that manufacturers should not only assess security before a device is released but also restart monitoring it as new threats emerge.

(Freyer et al. 2024)

In Corazón's case, having a clear plan for reporting vulnerabilities, providing security updates and responding to future threats could help protect patients. I find your point about social equality extremely important. Making medical implants more affordable is a positive step, but all patients should receive an equal level of protection, regardless of their financial circumstances. I would add that manufacturers should also make security information and updates easy for patients to understand and access. Your post conveys few strong points about the importance of professional ethics in healthcare technology. I think that the argument could be further developed by highlighting that following ethical guidelines and meeting legal requirements are not always enough on their own. Professionals must also exercise judgement and act when potential risks to patients are identified.

(*********, 2025).
